

Strong growth predicted for new pallet-less FIBC of Storsack!

Winner of the German Packaging Award (Deutscher Verpackungspreis) and the Worldstar 2008!

For several years Storsack has been experimenting with pallet-less FIBC, a bulk bag with an integrated pallet which is expected to prove especially popular with food producers. In this industry a wooden pallet is a potential source of bacterial contamination or mould with the results that they need to be regularly heat treated for sterilisation. The system is simple but very clever. An advantage of this super light pallet is that it will not harbour bacteria or mould. Weighting no more than about 5 kg, it is also significantly lighter than its wooden or plastic counterparts which weigh 20-25 kg. It can also be adjusted to fit the footprint of any FIBC, forming part of the FIBC either provisionally or permanently. It can be handled with a conventional forklift from two or four side. This unique design won a packaging award at the annual **German Verpackungswettbewerb** and is a recipient of **Worldstar 2008**.

Benefits

- No bacterial contamination, no mould
- Extremely flat design and light
- compatible to all FIBC
- durable and easy gliding insert
- easy to discharge just by lifting
- 2-way or 4-way accessible insert
- Fully Recyclable
- Cost and space saving at every stage of the logistic chain
- No removable sleeves
- suitable for all kind of goods (granule or heavy powder)
- Stackable

Easy gliding sleeves

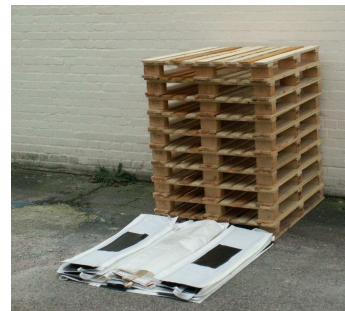

Perfect performance even in case of automatic filling

2-way or 4-way, the choice is yours!

See the difference!
